Creating Value Through Efficient Planning

Results of programming project competition 02285 AI and MAS, SP18

- Teams get two scores per level: one for number of actions (action cost), and one for time spent (time cost).
- Each score is a number 0.00-1.00.
- Score is 1.00 for best known solution (minimum action cost, minimum time cost).
- Score is 0.00 if level is not solved.
- Otherwise the action score for team X on level L is

 $\frac{\text{least number of actions used by any team on level } L}{\text{number of actions used by team } X \text{ on level } L}$

and the time score is

 $\frac{\log(\text{fewest number of milliseconds used by any team on level } L)}{\log(\text{number of milliseconds used by team } X \text{ on level } L)}$

• The action and time scores obtained on the individual levels within a track are summed up. For each track there are two winners: those with largest action score sum, and those with largest time score sum.

SA track, used actions

The table on the following slide shows the **action scores** achieved for the **SA track**. Example of formatting of scoring table:

size of rectangle represents score of (team,level) ompetition results – p. 3/11

SA track, completion time

The table on the following slide shows the **time scores** achieved for the **SA track**.

MA track, used actions

The table on the following slide shows the action scores achieved for the MA track.

MA track, completion time

The table on the following slide shows the **time scores** achieved for the **MA track**.
